Azure network round-trip latency statistics

Feedback

Summarize this article for me

In this article

This article provides round-trip latency statistics between Azure regions to help you optimize your cloud architecture and deployment decisions. The data comes from continuous network monitoring across Azure's global infrastructure and represents real-world performance measurements.

Use these statistics to:

Plan multi-region deployments for optimal performance

Select regions that minimize latency for your users

Design disaster recovery strategies with latency considerations

Benchmark expected performance between specific region pairs

What is round-trip latency?

Round-trip latency is the time it takes for a data packet to travel from one point in the network to another and back again. In the context of Azure, it measures the time taken for a packet to travel between two Azure regions. This metric is crucial for applications that require low-latency communication, such as real-time data processing, gaming, and financial transactions.

How is latency measured?

Azure measures round-trip latency using internal network probes that continuously monitor the performance of the Azure backbone network. These probes send data packets between Azure regions and record the time taken for the packets to travel to their destination and back. The measurements are collected in 1-minute intervals, providing a detailed view of network performance over time.

The latency statistics presented in this article are based on the 50th percentile (P50) of these measurements, which represents the median round-trip time. This means that half of the measured round-trip times are below this value, providing a reliable indicator of typical network performance.

Round-trip latency data by region

The following tabs show the monthly percentile P50 round-trip times between Azure regions for a 30-day window. Latency values are in milliseconds (ms).

The current dataset dates from July 30, 2026 and covers the 30-day period ending on July 30, 2026 .

For readability, tabs divide each table into groups of Azure regions. The tabs organize data by region, then by source region in the first column of each table. For example, the East US tab also shows latency from all source regions to the two East US regions: East US and East US 2 .

Each latency value is directional. The latency from one region to another can differ from the latency in the reverse direction because traffic might take a different network path each way. When you compare regions, use the value that matches the direction your traffic flows.

How to read the latency tables

Each table lists the source region in the first column and each destination region across the top row. To find a latency value, locate the row for your source region, then read across to the column for your destination region. The value is the P50 (50th-percentile, or median) round-trip time in milliseconds.

For example, in the East US tab, the row for source East US and the column for destination East US 2 shows a latency of 8 ms. Because latency is directional, the reverse path uses a different value: the row for source East US 2 and the column for destination East US shows 9 ms. Always use the value that matches the direction your traffic flows.

To measure latency between your own workloads rather than between regions, see [Test VM network latency to run a VM-to-VM latency test in your Azure subscription](#).

Important

Monthly latency numbers across Azure regions rarely change. Expect an update to these tables every 6 to 9 months. The following tables don't list all public Azure regions. When new regions come online, we update this document as soon as latency data becomes available.

North America / South America

Europe

Asia-Pacific (APAC)

Middle East / Africa

Latency tables for Americas regions including US, Canada, and Brazil.

Use the following tabs to view latency statistics for each region.

Latency tables for European regions.

Use the following tabs to view latency statistics for each region.

Latency tables for Australia, Asia, and Pacific regions including and Australia, Japan, Korea, and India.

Use the following tabs to view latency statistics for each region.

Latency tables for Middle East / Africa regions including UAE, South Africa, Israel, and Qatar.

Use the following tabs to view latency statistics for each region.
